For Professional Use Only

# CMV/EBV/HHV6 Quant Real-TM Handbook

Multiplex Real Time PCR Kit for quantitative detection and differentiation of Cytomegalovirus (CMV), Epstein Barr Virus (EBV) and Human Herpes 6 Virus (HHV6)

**REF V48-100FRT** 

## NAME CMV/EBV/HHV6 Quant Real - TM

#### **INTENDED USE**

The **CMV/EBV/HHV6 Quant Real-TM** is a "Real-Time Amplification" test for the quantitative detection and differentiation of Cytomegalovirus (CMV), Epstein Barr Virus (EBV) and Human Herpes 6 Virus (HHV6) in the biological materials. DNA is extracted from samples, amplified using real time amplification with fluorescent reporter dye probes specific for CMV/EBV/HHV6 and Internal Control (IC). Test contains an IC ( $\beta$ -globine gene) which allows controlling both PCR-analysis stages (DNA extraction and PCR amplification), material sampling, and storage conditions.

## **PRINCIPLE OF PCR DETECTION**

CMV, EBV and HHV6 detection by polymerase chain reaction (PCR) with hybridization-fluorescence detection includes DNA extraction from clinical samples and PCR amplification of pathogen genome specific region with real-time hybridization-fluorescence detection. During DNA extraction from clinical material, human genomic DNA (endogenous internal control) is amplified. Endogenous internal control (IC Glob) allows controlling both PCR-analysis stages (DNA extraction and PCR amplification), material sampling, and storage adequacy. Then, the obtained samples are amplified using specific primers and polymerase (TaqF). In real-time PCR, the amplified product is detected using fluorescent dyes. These dyes are linked to oligonucleotide probes which bind specifically to the amplified product during thermocycling. The real-time monitoring of the fluorescence intensities during the real-time PCR allows the detection of accumulating product without re-opening the reaction tubes after the PCR run.

## MATERIALS PROVIDED

| Reagent   | Description            | Volume, ml | Quantity |
|---|------------------------|------------|----------|
| PCR-mix-1-FRT EBV/CMV/HHV-6/Glob                          | colorless clear liquid | 0.6        | 2 tubes  |
| PCR-mix-2-FRT   | colorless clear liquid | 0.3        | 2 tubes  |
| Polymerase (TaqF)   | colorless clear liquid | 0.03       | 2 tubes  |
| RNA-buffer  | colorless clear liquid | 0.6        | 1 tube   |
| DNA calibrator KSG1                                       | colorless clear liquid | 0.2        | 1 tube   |
| DNA calibrator KSG2                                       | colorless clear liquid | 0.2        | 1 tube   |
| Negative Control (C-)*                                    | colorless clear liquid | 1.2        | 2 tubes  |
| Positive Control DNA <i>EBV/CMV/HHV-6</i> and human DNA** | colorless clear liquid | 0.1        | 2 tubes  |

\* must be used in the extraction procedure as Negative Control of Extraction.

\*\* must be used in the extraction procedure as Positive Control of Extraction (PCE).

## MATERIALS REQUIRED BUT NOT PROVIDED

- DNA extraction kit.
- Disposable powder-free gloves and laboratory coat.
- Automated pipettors (dosers) of variable volumes (from 5 to 20 µl and from 20 to 200 µl).
- Disposable tips with aerosol barriers (100 or 200 µl) in tube racks.
- Tube racks
- Vortex mixer/desktop centrifuge.
- PCR box.
- Personal thermocyclers for example Rotor-Gene 6000 (Corbett Research,); Rotor-Gene Q (Qiagen) iQ5 and iCycler iQ (Bio-Rad), Mx3005P (Stratagene) or equivalent.
- Disposable polypropylene microtubes for PCR or PCR-plate.
- Refrigerator for 2–8 °C.
- Deep-freezer for  $\leq -16$  °C.
- Waste bin for used tips.

#### **STORAGE INSTRUCTIONS**

All components of the **CMV/EBV/HHV6 Quant Real-TM** PCR kit (except for PCR-mix-1-FRT *EBV/CMV/HHV-6*/Glob, PCR-mix-2-FRT, and Polymerase (TaqF)) are to be stored at 2–8 °C when not in use. The kit can be shipped at 2-8°C but should be stored -20°C immediately on receipt.

The shelf life of reagents before and after the first use is the same, unless otherwise stated.

## STABILITY

IVD

**CMV/EBV/HHV6 Quant Real-TM** Test is stable up to the expiration date indicated on the kit label. The product will maintain performance through the control date printed on the label. Exposure to light, heat or humidity may affect the shelf life of some of the kit components and should be avoided. Repeated thawing and freezing of these reagents should be avoided, as this may reduce the sensitivity. Components stored under conditions other than those stated on the labels may not perform properly and may adversely affect the assay results.

## WARNINGS AND PRECAUTIONS

## In Vitro Diagnostic Medical Device

For In Vitro Diagnostic Use Only

- 1. Wear disposable gloves, laboratory coats and eye protection when handling specimens and reagents. Thoroughly wash hands afterward.
- 2. Do not pipette by mouth.
- 3. Do not eat, drink, smoke, apply cosmetics, or handle contact lenses in laboratory work areas.
- 4. Do not use a kit after its expiration date.
- 5. Dispose of all specimens and unused reagents in accordance with local regulations.
- 6. Biosafety Level 2 should be used for materials that contain or are suspected of containing infectious agents.
- 7. Clean and disinfect all spills of specimens or reagents using a disinfectant such as 0,5% sodium hypochlorite, or other suitable disinfectant.
- 8. Avoid contact of specimens and reagents with the skin, eyes and mucous membranes. If these solutions come into contact, rinse immediately with water and seek medical advice immediately.
- 9. Material Safety Data Sheets (MSDS) are available on request.
- 10. Use of this product should be limited to personnel trained in the techniques of DNA amplification.
- 11. PCR reactions are sensitive to contamination. Measures to reduce the risk of contamination in the laboratory include physically separating the activities involved in performing PCR in compliance with good laboratory practice.
- 12. Workflow in the laboratory must proceed in a uni-directional manner, beginning in the Extraction Area and moving to the Amplification and Detection Area. Do not return samples, equipment and reagents in the area where you performed previous step.

Some components of this kit contain sodium azide as a preservative. Do not use metal tubing for reagent transfer.

## PRODUCT USE LIMITATIONS

All reagents may exclusively be used in in vitro diagnostics. Use of this product should be limited to personnel trained in the techniques of DNA amplification (UNI EN ISO 18113-2:2012). Strict compliance with the user manual is required for optimal PCR results. Attention should be paid to expiration dates printed on the box and labels of all components. Do not use a kit after its expiration date.

## **QUALITY CONTROL**

In accordance with Sacace's ISO 13485-Certified Quality Management System, each lot is tested against predetermined specifications to ensure consistent product quality.

## SAMPLE COLLECTION, STORAGE AND TRANSPORT

CMV/EBV/HHV6 Quant Real-TM can analyze DNA extracted from:

- whole peripheral and umbilical cord blood collected in either ACD or EDTA tubes;
- buffy coat;
- plasma;
- *tissue* homogenized with mechanical homogenizer and dissolved in PBS sterile;
- urine (sediment);
- *swabs:* insert the swab into the nuclease-free 1,5 ml tube and add 0,2 mL of Transport medium. Vigorously agitate swabs in medium for 15-20 sec.
- CSF (Liquor);

It is recommended to process samples immediately after collection. Store samples at 2-8 °C for no longer than 24 hours, or freeze at -20/80°C. Transportation of clinical specimens must comply with country, federal, state and local regulations for the transport of etiologic agents.

#### **DNA ISOLATION**

Any commercial RNA/DNA isolation kit, if IVD-CE validated for the specimen types indicated herein at the "SAMPLE COLLECTION, STORAGE AND TRANSPORT" paragraph, could be used.

Sacace Biotechnologies recommends to use the following kits:

- $\Rightarrow$  **DNA-Sorb-B** (Sacace, REF K-1-1/B);
- $\Rightarrow$  **DNA/RNA-Prep** (Sacace, <u>REF</u> K-2-9);
- $\Rightarrow$  SaMag Viral Nucleic Acids Extraction Kit (Sacace, REF SM003, for plasma);
- $\Rightarrow$  SaMag STD DNA Extraction Kit (Sacace, REF SM007, for urine sediment).

Extract DNA according to the manufacturer's instructions.

Transfer 100 µl of Negative Control to the tube labeled C–. Transfer 90 µl of Negative Control and 10 µl of Positive Control DNA *EBV/CMV/HHV-6* and human DNA to the tube labeled PCE.

## PROTOCOL (Reaction volume 25 μl):

- 1. Prepare in the new sterile tube for each sample 10\*N μl of PCR-mix-1 "CMV/EBV/HHV6/IC", 5,0\*N μl of PCR-Buffer-FRT and 0,5\*N μl of TaqF DNA Polymerase. Vortex and centrifuge for 2-3 sec.
- 2. Prepare required quantity of reaction tubes for samples and controls and add 15 µl of Reaction Mix and 10 µl of extracted DNA sample to appropriate tube. Mix by pipetting.

(*Re-centrifuge all the tubes with extracted DNA for 2 min at maximum speed (12000-16000 g) and take carefully supernatant. N.B. don't disturb the pellet, sorbent inhibit reaction!*).

3. <u>For qualitative analysis:</u>

NCA - Add 10 µl of RNA-buffer to the tube labeled NCA (Negative Control of Amplification).

C+ - Add 10 μl of DNA calibrator KSG2 to the tube labeled C+ (Positive Control of Amplification).

4. For quantitative analysis:

| NCA                          | - Add 10 µl of RNA-buffer to the tube labeled NCA (Negative Control of Amplification). |
|------------------------------|--|
| Calibrators<br>KSG1 and KSG2 | - Add 10 $\mu$ l of KSG1 to two tubes and add 10 $\mu$ l of KSG2 to other two tubes    |

Close tubes and transfer them into the instrument in this order: samples, negative controls, positive control, Standards.

<sup>1</sup> For example Rotor-Gene<sup>TM</sup> 6000/Q (Corbett Research, Qiagen)

<sup>2</sup> For example, SaCycler-96<sup>™</sup> (Sacace), iQ5<sup>™</sup> (BioRad); Mx3005P<sup>™</sup> (Agilent Technologies), ABI® 7500 Real Time PCR (Applied Biosystems), SmartCycler® (Cepheid)

## **RESULTS ANALYSIS**

 $\beta$ -Globin gene DNA (IC) is detected in the FAM/Green channel, *EBV* DNA is detected in the JOE/HEX/Cy3/Yellow channel, *CMV* DNA is detected in the ROX/Texas Red/Orange channel, and *HHV6* DNA is detected in the Cy5/Red channel.

## **Interpretation of results**

The results are interpreted by the software of the used Instrument by the crossing (or not) of the fluorescence curve with the threshold line.

- 1. The sample is considered to be **positive** for *EBV* DNA if its Ct value in the results grid on the JOE/HEX/Cy3/Yellow channel is detected and does not exceed the threshold value of positive result.
- 2. The sample is considered to be **positive** for *CMV* DNA if its Ct value in the results grid on the ROX/Orange/Texas Red channel is defined and does not exceed the threshold value of positive result.
- 3. The sample is considered to be **positive** for *HHV6* DNA if its Ct value in the results grid on the Cy5/Red channel is defined and does not exceed the threshold value of positive result.
- 4. For qualitative analysis, the sample is considered to be **negative** if its Ct value in the results grid in the FAM/Green channel does not exceed the Ct value indicated in the **Boundary Ct values** table.
- 5. For quantitative analysis, the quantity of IC Glob DNA should be greater than 2000 copies per reaction for whole blood, white blood cells, viscera biopsy material or more than 500 copies per reaction for saliva and oropharyngeal swabs.

For cerebrospinal fluid (liquor), the Ct value can be greater than the Ct value indicated in the **Boundary Ct** values table in the results grid in the FAM/Green channel or the quantity of IC Glob DNA can be less than 500 copies per reaction in case of quantitative analysis because the cerebrospinal fluid samples may contain a very small number of cells.

- 6. For **qualitative** analysis, the result of analysis is considered to be **invalid** if the Ct value is not detected in the results grid (the fluorescence curve does not cross the threshold line) or if it is greater than the threshold value in the JOE/HEX/Yellow, ROX/Orange, or Cy5/Red channel and the Ct value in the results grid in the FAM/Green channel exceeds the Ct value indicated in the **Boundary** Ct values table.
- 7. For **quantitative** analysis, the analysis result is considered to be **invalid** if the Ct value is not detected in the results grid (the fluorescence curve does not cross the threshold line) or if it is greater than the boundary value in the JOE/Yellow/HEX, ROX/Orange, or Cy5/Red channel and the quantity of IC Glob DNA is less than 2000 copies per reaction for whole blood, white blood cells, viscera biopsy material or if it is less than 500 copies per reaction for saliva and oropharyngeal swabs. In such cases, PCR analysis of the sample should be repeated.
- 8. For qualitative analysis, results of analysis are considered reliable only if the results obtained for both Positive and Negative Controls of amplification as well as for the Negative Control of extraction are correct. For quantitative analysis, results on C+ should fall in range of concentrations indicated in the **Product Data Card**.

Boundary Ct values for Plate type instruments like SaCycler-96<sup>™</sup> (Sacace); iQ5<sup>™</sup> (BioRad); Mx3005P<sup>™</sup> (Agilent Technologies); ABI® 7500 Real Time PCR (Applied Biosystems); SmartCycler® (Cepheid)

#### Quantitative results

In quantitative analysis, if total DNA is extracted from human whole blood, white blood cells and biopsy material, the concentration in log of DNA copies per standard cell quantity  $(10^5)$  in control and test samples is calculated by the following formula:

#### For *CMV*:

## $\log \{ \frac{CMV \text{ DNA copies in PCR sample}}{\text{Glob DNA copies in PCR sample}} \ge 2*10^5 \} = \log \{ CMV \text{ DNA copies/10}^5 \text{ of cells} \}.$

#### For *EBV*:

## $\log \{ \frac{EBV \text{ DNA copies in PCR sample}}{\text{Glob DNA copies in PCR sample}} \ge 2*10^5 \} = \log \{ EBV \text{ DNA copies/10}^5 \text{ of cells} \}.$

## For *HHV*6:

## log { <u>HHV6 DNA copies in PCR sample</u> x 2\*10<sup>5</sup>}=log {HHV6 DNA copies/10<sup>5</sup> of cells}. Glob DNA copies in PCR sample

The results can be calculated manually or using Excel tables. To do this copy the names of the samples and insert them in the first column (Column A). Copy the concentrations of EBV DNA from the channel Joe(Yellow)/HEX/Cy3 and paste in the second column of Excel table (Column B). Copy the concentrations of IC Glob from the channel Fam (Green) and paste in the third column of Excel table (Column C). Insert in the column D the formula D=LOG (B/C\*200000): log values will appear.

| Name    | Calc Conc<br>(copies/reaction)<br>Joe(Yellow)/HEX/Cy3 | Calc Conc<br>(copies/reaction)<br>Fam(Green) | log EBV/10 <sup>5</sup> cells |
|---------|---|--|-------------------------------|
| Α       | В   | С  | D                             |
| 1       | 8742  | 125640                                       | 4,1                           |
| 2       | 253   | 87787  | 2,8                           |
| 3       |   | 65765  |                               |
| 4       | 648   | 16354  | 3,9                           |
| 5       |   | 76865  |                               |
| QS1     | 9962  | 9793   |                               |
| QS1     | 10011   | 10143  |                               |
| QS2     | 98  | 103  |                               |
| QS2     | 102   | 97   |                               |
| Neg PCR |   |  |                               |

Use the same procedure for calculation of CMV (ROX/Orange/Texas Red channel) and HHV6 (Cy5/Red channel) log quantity inserting in the column B the relative results.

If total DNA is extracted from **saliva**, **oropharyngeal swabs** and **cerebrospinal fluid (liquor)**, the concentration of DNA per ml of sample (Conc <sub>DNA</sub>) is calculated by the following formula:

## Conc DNA = C DNA x 100 (copies/ml)

C DNA is the number of *EBV* DNA copies, or the number of *CMV* DNA copies, or the number of *HHV6* DNA copies in DNA sample.

#### Table2. Example of Qualitative Analysis (plate-type instrument)

| Ct limits (for plate type instruments) |    |    |    |  |  |  |
|--|----|----|----|--|--|--|

## **QUALITY CONTROL PROCEDURE**

CMV/EBV/HHV6 Quant Real-TM PCR contains the Internal Control IC (human beta-globine gene), which allows to control the presence of cellular material in the sample. If the sample is not correctly prepared or it is an insufficient quantity of epithelial cells the Internal Control will not be detected.

A negative control of extraction (NCE), negative amplification control (NCA), positive amplification control (C+) are required for every run to verify that the specimen preparation, the amplification and the detection steps are performed correctly.

If the controls are out of their expected range (see table Results for Controls), all of the specimens and controls from that run must be processed beginning from the sample preparation step.

## TROUBLESHOOTING

Results of analysis are not taken into account in the following cases:

- 1. The presence of any Ct value on JOE/Yellow/HEX, FAM/Green, ROX/Orange and Cy5/Red channels in the results grid for the Negative Control of Amplification (NCA) and for the Neg. Control of Extraction (C-) indicates contamination of reagents or samples. In this case, PCR analysis should be repeated for all samples in which pathogen DNA was detected starting from the DNA extraction stage.
- 2. For qualitative analysis, if the Ct value in the results grid for the Positive Control of PCR on the JOE/Yellow/HEX, FAM/Green, ROX/Orange, or Cy5/Red channels is absent, it is necessary to repeat amplification for all samples where pathogen DNA was not detected.
- 3. If the Ct value for the sample is not detected on JOE/Yellow/HEX/Cy3, ROX/Orange/Texas Red, Cy5/Red channel or it exceeds the boundary Ct value specified in the Boundary Ct values table and the Ct value for the sample is greater than the maximum Ct value for IC in the FAM/Green channel, analysis should be repeated starting from the DNA extraction stage. This error may be caused by incorrect treatment of clinical material, which resulted in the loss of DNA, or by the presence of PCR inhibitors.
- 4. If the Ct value for the sample is detected in JOE/Yellow/HEX/Cy3, ROX/Orange/Texas Red or Cy5/Red channel and it is greater than the boundary Ct value specified in the Boundary Ct values table, the result is considered to be equivocal. It is necessary to repeat analysis of such sample in duplicate. If a reproducible positive Ct value is obtained, the result is considered to be positive; otherwise, the result is considered to be equivocal.

## **PERFORMANCE CHARACTERISTICS**

## Sensitivity

The analytical sensitivity of CMV/EBV/HHV6 Quant Real-TM PCR kit is specified in the table below.

| Type of clinical material   | Nucleic acid extraction<br>kit | Sensitivity                               |  |
|---|--------------------------------|---|--|
| Cerebrospinal fluid (liquor), saliva,<br>oropharyngeal swabs, and lavages | DNA/RNA-Prep                   | 400 copies/ml                             |  |
| Whole human blood, white blood cells, viscera biopsy material             | DNA/RNA-Prep                   | 5 DNA copies<br>per 10 <sup>5</sup> cells |  |

## Specificity

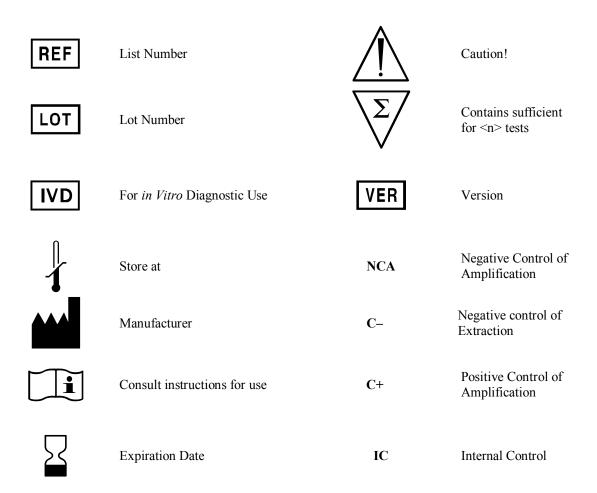

**CMV/EBV/HHV6 Quant Real-TM** PCR kit is intended for *Epstein-Barr virus* (*EBV*) DNA, *Human Herpes Virus* type 6 (*HHV6*) DNA and *human cytomegalovirus* (*CMV*) DNA detection. Specific activity of **CMV/EBV/HHV6 Quant Real-TM** PCR kit was confirmed by analysis of reference *CMV* strain AD 169, QCMD panel for *Epstein-Barr virus*, as well as by analysis of clinical material with subsequent confirmation of results by sequencing the amplified fragments. The activity of the PCR kit components with respect to DNA of other viruses (herpes simplex virus types 1 and 2, human herpes virus type 8, Varicella Zoster Virus, Parvovirus B19, and others), bacterial pathogens (*Staphylococcus aureus, Streptococcus pyogenes, Streptococcus agalactiae*, and others) and human DNA was absent. The clinical specificity of **CMV/EBV/HHV6 Quant Real-TM** PCR kit was confirmed in laboratory clinical trials.

Target region: CMV – MIE, EBV – LMP, HHV6 – pol gene
